

Phase 1 Reflection

Important things learned across 5 weeks

- Learned to build website skeleton with proper semantic structure using HTML
- Learned to style the html page with proper layouts and make it responsive
- Learned DOM manipulation, how to work with async processes , dynamic routing and advanced JS techniques.
- Learned how to create and manage a store and build a Single Page Application (SPA) with just Javascript
- Learned how to add types and interfaces to javascript codebases to ensure code stability, easy maintenance and to catch bugs easily.
- Learned how to create unit tests with mocks etc to test all the functions of the codebase.

Moment where something clicked

- The whole jest testing made a lot more sense when I tried testing the SPA application I built using javascript from scratch.

Areas to work on

- If i have to pin point, I would say testing event listeners and async processes have been a bit more time consuming than the rest.
